

# LUNGING ARENA

Lunging even in bad weather conditions

## Horses need exercise!

In the wild horses move between 30 and 50 km on a daily basis while they are grazing. In order to keep your horses healthy and strong they do need to be able to move around enough. A lack of exercise influences the horses' mental state negatively and often results in problems of their locomotor system. The exercise with a rider is often not enough therefore we need to consider other options in order to keep our four-legged friends healthy.

- Lunging arenas are built considering structural engineering calculations according to wind, snow and other environmental influences
- All steel construction parts are galvanized
- Steel construction divided into 12/14/16/19/22 sections consisting of IPE sections assembled on anchor bolts
- External enclosure consists of hardwood boards in steel frame 150cm high
- Other openings can be provided with wind gauze
- Roof consists of polyester coated box profile steel sheets
- The coated steel sheets are fixated on the steel bracing with special screws

**With our lungeing arenas you are able to lunge your horse even in bad weather conditions and the annoying debate regarding lunging in the indoor arena comes to an end!**

**-We also offer ideal footing solutions for your lungeing arena-**
